

GLOBAL INSTITUTIONAL EDITION / 2026

Technology with purpose.

Company profile · Selected portfolio · Institutional
proposal

Digital services. Intelligent workflows.
Accountable delivery.

ZEISMO

WEARLISTY SHOPPING SOLUTIONS LLC

Prepared for government bodies, public institutions
and enterprise partners worldwide.

EXECUTIVE PERSPECTIVE

A practical partner for digital progress.

ZEISMO combines product development, operational software and AI-assisted workflows to turn defined needs into usable digital services.

Build around the work

We focus on the complete service journey: the public interface, internal records, integrations, user permissions and the people responsible for the outcome. A useful application needs all of these parts to work together.

Demonstrate before expanding

Our proposed institutional approach starts with a bounded use case, a working prototype and agreed acceptance evidence. This gives decision-makers a concrete basis for evaluating scope, usability and operating requirements.

Bring an operator's perspective

Our portfolio includes a released WordPress SEO plugin, hosted customer-management and messaging offerings, and experience running our own commerce operation. These are practical foundations for discovery and delivery, not claims of prior government deployments.

Make responsibilities clear

We recommend named service owners, documented decisions, measurable acceptance criteria and a controlled route to production. Commercial terms, jurisdictional obligations and deployment requirements are settled in the engagement documents.

Our proposition: thoughtful engineering, clear communication and software that people can use with confidence.

STRATEGIC FOCUS / AI WORKFORCE

Software robots. AI agents. Less manual work.

ZEISMO's strategic focus is to replace selected human-operated workflows with software robots and AI agents, while preserving clear accountability for the outcomes.

The ambition

We aim to build systems that take on repeatable digital work: routine enquiry handling, information retrieval, record preparation, status updates, routing and other well-defined process steps. The objective is to reduce dependence on repetitive manual execution.

What replacement means

For a suitable workflow, the target is for an agent to perform the agreed task from input to outcome, with exception handling and a responsible owner. This may change staffing needs or role design; those decisions belong to the institution and require a managed transition.

What is available today

Our current portfolio includes AI-assisted messaging, software workflows and integrations. This strategy does not mean that a general-purpose autonomous workforce, unrestricted decision-maker or physical robotics product is already available.

How we propose to deliver it

Select a bounded task, establish its baseline, define permitted actions and test accuracy, reliability and escalation. Expand autonomy only after agreed evidence and approvals. Maintain human authority for consequential institutional decisions.

Software, not physical robotics

In this proposal, software robots means digital process automation and AI agents. It does not claim manufacturing or deployment of humanoid robots, industrial robots or other physical robotic hardware.

Strategic direction: automate the work that can be defined and verified, then redesign the operating model responsibly.

LET'S DEFINE THE FIRST ENGAGEMENT

Bring us the challenge.

We will help turn it into a clear scope, a practical demonstration and a decision you can evaluate.

01 / Share the objective

Describe the service, intended users, current process and the outcome that matters.

02 / Identify the constraints

Confirm data sensitivity, procurement route, integrations, hosting and required approvals.

03 / Agree a discovery

Define the first deliverables, responsible people and evidence needed to decide the next phase.
